SEQUENCE IDENTITY & AUTO-INCREMENT IN SNOWFLAKE

SEQUENCE

ROW Numbers : SEQUENCE object and IDENTITY property use to generate a sequence of numeric values in an ascending order.

Generating Sequences with Snowflake is straight forward like other Databases such as Oracle, While the value in an identity column created by the server.

However, being same in functionality, there are several differences among Row Numbers i.e. the IDENTITY property and SEQUENCE object.

LET THE DATA DO THE TALKING...

⚠ Caution

Snowflake uses a sequence to generate the values for an auto-incremented column. Sequences have limitations; see Sequence Semantics.

The default value for both start and step/increment is 1.

AUTOINCREMENT and IDENTITY can be used only for columns with numeric data types.

Default: No value (the column has no default value)

✎ Note

`DEFAULT` and `AUTOINCREMENT` are mutually exclusive; only one can be specified for a column.

SEQUENCE CODE

```
#SEQUENCE
CREATE OR REPLACE SEQUENCE empid
start = 1
INCREMENT = 1
comment = 'this sequence will be used to generate employee IDs';
```

snowflake

ANALYTICS WITH ANAND

SEQUENCE IMPLEMENTATION

```
CREATE OR REPLACE SEQUENCE empid
start = 100
INCREMENT = 1
comment = 'will be used to generate sequential numbers';

create or replace table employees(ROW_NUMBER integer default empid.nextval,
                    employee_id number,
                    salary number,
                    Age number);

insert into employees (employee_id, salary, Age)
                        values(1,40000,41),
                              (2,50000,29),
                              (3,30000,35);
select * from employees;
```

IDENTITY

```
#IDENTITY
create or replace table employees(row_number integer identity(100,1),
                        employee_id number,
                        salary number,
                        Age number);
```

Association

SEQUENCE object are define *by the user and can be share by multiple tables since is it is not tie to any table.*

*IDENTITY property t*ies *to a particular table and cannot be shared among multiple tables since it is a table column property.*

VALUE GENERATION:

- However, In order to *generate the next IDENTITY value, it is must we should insert a new row into the table.*
- *On the other hand, the next VALUE for a SEQUENCE object can simply be generated using the **SEQ.NEXTVAL** clause with the sequence object.*

Example:

For instance, There is no alternative to get the next value for the IDENTITY property tied to the row_number column of employees_IDEN table, except by inserting a new row in the table. On the other hand, the value for a SEQUENCE object can be incremented without inserting a row into a table. Execute the following script:

```
select empid.nextval
```

snowflake

VALUE RESET:

- *IDENTITY property cannot reset to its initial value. In contrast, the value for the SEQUENCE object c*an *reset* by recreating the Sequences. Traditionally CYCLE parameter is not available in Snowflake like SQL/ORACLE.
- **Auto Increment and Identity:**
- Similarly, **Auto Increment** is a function that operates on numeric data types. Hence, It automatically generates sequential numeric values every time that a record inserts into a table for a field defined as **auto increment**.
- Column constraints AUTO_INCREMENT and IDENTITY are synonyms that associate a column with a sequence. This sequence automatically increments the column value as new rows adds to the table.
- You define an AUTO_INCREMENT/IDENTITY column in a table as follows:

snowflake

ANALYTICS WITH ANAND

AUTO_INCREEMENT CODE

```
create or replace table employees_auto(row_number integer autoincrement start 5000 increment 10,
                    employee_id number,
                    salary number,
                    Age number);
```

```
insert into employees_auto (employee_id,  salary, Age)
                                values(1,40000,41),
                                      (2,50000,29),
                                      (3,30000,35);

select * from employees_auto;
```

snowflake

ANALYTICS WITH ANAND

AUTO INCREMENT

```
CREATE TABLE table-name...
  (column-name {AUTO_INCREMENT | IDENTITY} [(args)], ...)
```

AUTO_INCREMENT/IDENTITY sequences are owned by the table in which they are defined, and do not exist outside that table.

Unlike named sequences, you cannot manage an AUTO_INCREMENT/IDENTITY sequence with ALTER SEQUENCE.
